

Utilize one of the worlds most valuable resources:

WATER

Rain barrels collect and store rooftop rainwater runoff and store it to be used for gardening and lawn care at the homeowner's convenience. Without the rain barrel this water flows as waste onto paved surfaces and eventually into drainage systems.

Example:

A square house 39'x39' with 1 foot overhangs has 1600 square feet of roof catchment area, or area producing runoff. From this 1600 sq. ft. single inch of rainfall will produce 960 gallons of runoff that could be collected.
